

Fullflow Flying High at New Production Facility.

Boeing's hi-tech £40m production facility in Sheffield will be a showcase for innovation.

It is Boeing's first manufacturing centre in Europe and is part of a wider effort to concentrate manufacturing best practice in-house.

The company is keen to access Sheffield's growing pool of talent and capability. Fullflow were called in by the consulting engineers to add their unrivalled technical expertise in designing and manufacturing a syphonic roof drainage system.

The opportunity to be involved during an early stage of the design process provided information sharing opportunities for both the client and Fullflow. The complex and innovative saw tooth roof design required the design of a bespoke roof drainage system. Draining a total roof area of 5300 m², through 28 Primaflow 09 syphonic rainwater outlets and 7 downpipes, the polyethylene pipework ensures that water is efficiently removed from the roof during the heaviest of rainstorms.

Like Fullflow, Finnigans the main contractor, have their base in Sheffield. This considered choice of contracting companies kept a local feel during the design and construction process.

Welcome to Sheffield Boeing, may your stay be long and successful.
